#### **APPENDIX I**

# The PICO Search Strategy.1

## Context

Efficiency of a search strategy for answering healthcare related question entails acquisition of as much relevant and as little irrelevant information as possible. This is more likely when search in evidence based practice is approached methodically. For this reason, the PICO strategy was developed.

## Objective

The PICO strategy was designed to allow for a well-structured research question which by extension will allow correct definition of information that should be sourced. There is also a better focus on the research objectives with avoidance of unnecessary searches.

## Methods

The PICO process starts with framing of the research question from which the PICO elements can be extracted. The components of the various PICO elements are combined and re-adjusted to generate necessary search queries. See Table below;

## APPENDIX II

Institute of Medicine (IOM) Standards for developing Trustworthy Clinical Practice Guidelines.<sup>2</sup>

#### Context:

With marked increase in randomized controlled trials and more than 3 700 guidelines from 39 countries as at 2011, quality and trustworthiness of these guidelines becomes an issue. Several questions arise viz: on what evidence are these practice guidelines based? Is there any bias in the development process? How rigorous were the methods used in the guideline development? How relevant are the guidelines to subpopulations?

### Objective:

In a bid to standardize evidence-based clinical practice guidelines, the United State Congress asked the Institute of Medicine (the health division of the United State National Academy of Sciences designed to answer health- and healthcare-related questions) to determine the best approach to designing a clinical practice guideline. The IOM standard was developed to ensure quality and reliability by transparency, reproducibility and scientifically valid results.

#### Methods

The IOM recommends that all clinical practice guidelines comply with eight standards: establishing transparency; management of conflict of interest; guideline development group composition; systematic review; recommendations should be rated according to strength of evidence; articulation of recommendation; external review; updating.

## Application in this Review

- Transparency: A guideline was deemed to be transparent if the processes by which the guideline was developed and it's funded is explicitly stated.
- Conflict of interest: A guideline was said to have managed conflict of interest if there was disclosure OR guideline development process stated exclusion of conflicted members from leadership role.
- Guideline development group composition: A guideline was deemed to have fulfilled this standards if there was a minimum of the following: clinicians, diabetic patients. involved in the guideline development
- Systematic review: A guideline was deemed to have fulfilled this standard if it was based on systematic literature review.
- Grading strength of recommendations: A guideline was deemed to have fulfilled this standard if for at least three quarters of its recommendation, all of the following are included: evidence, harms, benefits, and level of confidence in the recommendation.
- Articulation of recommendation: A guideline was deemed to have fulfilled this standard if at least three quarters of its recommendations are actionable i.e. under what circumstances, the responsible provider, and how the recommendation should be carried out is clearly stated.
- External review: A guidelines was considered externally reviewed if it was made available to the general public OR its representative for comment prior to release AND relevant stakeholders i.e. organizations and agencies were involved.
- Updating: A guideline was deemed to have fulfilled this standard if a proposed date for future review was stated.
